ONE Clinical Pain Management Protocol

POSSIBLE F-TAG/QMS

Survey Regulations

- F 697 Pain Management
- F 676- Maintain ADL, Mobility, and Communication Abilities

Quality Measures

- Falls with Injury
- Pressure Injuries
- Antipsychotic Use
- ER Visits
- Hospitalizations

THERAPIES

- PT
- OT
- ST

PURPOSE OF THERAPY

- To identify most appropriate ways of communicating pain to care providers
- To address pain in a non-pharmacological approach
- To effectively monitor pain and pain response as it affects functional performance

GOAL EXAMPLES

- Patient will achieve __ degrees of shoulder ROM with 2/10 report of pain.
- Pt will reduce low back pain from 8 to 3/10 with use of modalities during OOB functional activities.
- Patient will decrease need for pain medication to PRN with use of therapeutic interventions with pain level of 1-3/10 reported during ADLs/mobility.
- Patient will utilize established pain rating scale during all episodes of care with 100% carryover.
- Patient will be able to demonstrate clear communication of pain 5/5 occasions using established communication methods.
- Patient will utilize pain assessment strategies with trained caregiver during ADL performance for 5/5 occasions.
- The patient will improve response to adapted pain scale with trained caregiver to 75% of the time to improve communication of pain and medical needs.

TOOLS, ASSESSMENTS & IMPLEMENTATION

TOOLS & ASSESSMENTS

PCC Assessments:

- Pain Scales
- Weights & Vitals Exception Report
- Resident Response Analyzer (Reports-Resident Response Analyzer-Set Date Range-Select LN Pain Interview-Select Questions-Run Report)

Visual Analogue Scale -The intensity of pain is rated on a line marked from no pain at one end, to as bad as it could possibly be at the other end. Can be used with most patients, caution with cognitive impairments.

The Numeric Rating Scale (NRS) is a tool to rate the intensity of pain on a scale from 0-10. The Verbal Numeric Rating Scale may have a limited role for communication or cognitively impaired patients.

Faces Pain Scale - The scale usually has six faces ranging in expression from smiling to crying, and they carry numbers from 0 to 5 which would be assigned to a pain level

The Pain Thermometer - Patients can simply point to a word which resembles how they are feeling at that time.

#ONE Clinical Pain Management Protocol

POSSIBLE F-TAG/QMS	THERAPIES	PURPOSE OF THERAPY	GOAL EXAMPLES	TOOLS, ASSESSMENTS & IMPLEMENTATION
			• The patient will answer simple yes/no questions via head nod, thumbs up/down, or visual aid with 60% accuracy with trained caregiver to improve ability to participate in meaningful interactions, communicate pain to trained caregivers, and participate in ADLs. • The patient will display appropriate word finding during structured and unstructured tasks with 80% to improve ability to participate in meaningful interactions, communicate pain to trained caregivers, and participate in facility activities. • The patient will make a binary choice on 3/5 opportunities to communicate preferences about the care and activities within a structured supportive to decrease behavioral outburst episodes relating to pain and resistance to care.	**Intervention** • Ultrasound • Diathermy • Electrical Stimulation • Heart Rate Variability • Biofeedback • Manual therapy/Massage • Stretching • Myofascial Release • Vital signs pre, during and post treatment
